

Make the task of topping up the header tanks on a PulsaCoil appliance easier with the new

# Easifil system

# The new Easifil system

Gledhill Response are pleased to inform residents that a safe solution to making the task of topping up the header tanks on a PulsaCoil appliance easier has been developed.

It is now simply a matter of pushing a button on the wall, installed in a position to suit yourself, without the inconvenience of climbing up step ladders or onto chairs.

Where a sight glass is not already fitted to the header tank, one will be included in the price, so that the level of the water held inside is clearly visible.\*\*

## How does it work?

The **Easifil** button is connected to the mains cold water supply by a length of pipework. This is installed at an easy to reach location within the cupboard.

From the **Easifil** button, the pipework is then connected to the header tank through a conventional ball valve. The ball valve acts as a safety device, ensuring the header tank cannot be overfilled. If the water level in the header tank becomes low, which is easily monitored through the sight glass fitted to the side of the tank, simply press the **Easifil** button until the water level reaches the correct level. Releasing the button automatically cuts off the water supply.

Contact a member of the Gledhill Response team on the number shown below.

The **Easifil** system is available  
for a cost of **£180** inclusive of VAT\*

\* The above price is based on a typical property where work can usually be completed within an approximate 50 minute period and no more than 2 metres of pipework is required. Any additional cost will be outlined and agreed prior to work being commenced.

\*\* A free of charge sight glass installation on metal header tanks is subject to the tank condition.
